Abstract: The current research work was aimed to investigate the impact of The Trivedi Effect® - Energy of Consciousness Healing Treatment (Biofield Energy Healing) on the structural properties and isotopic abundance ratio ($P_{M+1}/P_M$) of magnesium gluconate using LC-MS and NMR spectroscopy. Magnesium gluconate was divided into two parts. One part was denoted as the control, while the another part was defined as The Trivedi Effect® Treated sample, which received the Biofield Energy Healing Treatment remotely from eighteen renowned Biofield Energy Healers. The total ion chromatogram of the control sample showed two peaks at $R_t$ of 1.81 and 2.06 min, whereas the treated sample displayed two peaks at $R_t$ of 2.04 min. The ESI-MS spectra of the control and the treated samples revealed the presence of the mass for magnesium gluconate ion in two forms at $m/z$ 447 (adduct form with methanol) and 415 (protonated ion) in positive ionization mode. But, it showed the mass for the gluconate ion at $m/z$ 195 in the negative ionization mode. The fragmentation pattern of magnesium gluconate in the treated sample was notably altered compared with the control sample. The proton and carbon signals for CH, CH$_2$ and CO groups in the proton and carbon NMR spectra were found almost similar for the control and treated samples. The LC-MS based isotopic abundance ratio analysis indicated that the $P_{M+1}/P_M$ ($^{2}$H/$^1$H or $^{13}$C/$^{12}$C or $^{17}$O/$^{16}$O or $^{25}$Mg/$^{24}$Mg) in the treated magnesium gluconate ion at $m/z$ 415 was significantly decreased by 79.24% compared with the control sample. Similarly, the isotopic abundance ratio of $P_{M+1}/P_M$ ($^{2}$H/$^1$H or $^{13}$C/$^{12}$C or $^{17}$O/$^{16}$O) in the gluconate ion was decreased by 6.62% in the treated sample compared with the control sample. The treated magnesium gluconate might be beneficial in the nutraceutical and/or pharmaceutical industries for designing various forms of formulations, which could be providing better therapeutic response against various diseases such as diabetes mellitus, allergy, aging, inflammatory diseases, immunological disorders, and other chronic infections. Consequently, The Trivedi Effect® - Energy of Consciousness Healing Treated...
magnesium gluconate would be more helpful for understanding the enzymatic reactions as well as assist in the designing of the novel potent enzyme inhibitors by applying its kinetic isotope effects.

### 1. Introduction

Magnesium ion (Mg\(^{2+}\)) is a major intracellular divalent cation and an essential mineral for several enzymes, DNA and RNA synthesis, reproduction and protein synthesis. It is also a vital coherent controller of glycolysis and the Krebs cycle [1, 2]. Magnesium gluconate (C\(_{12}\)H\(_{22}\)MgO\(_4\)) is the organometallic salt of magnesium with gluconic acid produced from glucose catalyzed by glucose oxidase [3]. Magnesium gluconate is found to be a more powerful antioxidant than other magnesium salts and it is useful for the prevention and treatment of many diseases such as cardiovascular diseases, diabetes mellitus, allergy, inflammatory diseases, immunological disorders, Alzheimer’s disease, asthma, pre-eclampsia and eclampsia, cancer, etc. [4-8]. It can be used as neuroprotective [9], for the treatment of oxidative stress induced ischemia/reperfusion injury [10] and also labor in women arrested initially with intravenous therapy as an oral tocolytic agent [11]. Magnesium gluconate showed the highest bioavailability and most physiologically acceptable salt among other magnesium salts like chloride, sulfate, carbonate, acetate, citrate, lactate, aspartate, etc. [8, 12]. Therefore, magnesium gluconate was considered as one of the components in a novel proprietary herbomineral formulation for the source of magnesium ion. This herbomineral formulation which is designed as nutraceutical supplement can be used for the prevention and treatment of various human diseases.

Since ancient times, many different cultures, religions and systems of belief have recognized a living force that preserves and inhabits every living organism. This force is the source of ‘life’ and has been called various names, such as prana by the Hindus, qi or chi by the Chinese, and ki by the Japanese. This is believed to co-relate with the soul, spirit and mind. This hypothetical vital force has been scientifically evaluated and is now considered the Bioenergetics Field. The Biofield Energy is a dynamic electromagnetic field surrounding the human body, resulting from the continuous emission of low-level light, heat, and acoustical energy from the body. Biofield Energy is infinite, para dimensional and can freely flow between the human and environment [13, 14]. So, a human has the ability to harness energy from the ionosphere of the earth, the “universal energy field”, and transmit it to any living organism (s) or nonliving object (s) around the globe. The object or recipient always receives the energy and responds in a useful way. This process is known as The Trivedi Effect® - Biofield Energy Healing Treatment [15, 16]. Biofield (Putative Energy Field) based Energy Therapies are used worldwide to promote health and healing. The National Center of Complementary and Integrative Health (NCCIH) has recognized and accepted Biofield Energy Healing as a Complementary and Alternative Medicine (CAM) health care approach in addition to other therapies, medicines and practices such as natural products, deep breathing, yoga, Tai Chi, Qi Gong, chiropractic/osteopathic manipulation, meditation, massage, special diets, homeopathy, progressive relaxation, guided imagery, acupressure, acupuncture, relaxation techniques, hypnotherapy, healing touch, movement therapy, pilates, rolfing structural integration, mindfulness, Ayurvedic medicine, traditional Chinese herbs and medicines, naturopathy, essential oils, aromatherapy, Reiki, cranial sacral therapy and applied prayer (as is common in all religions, like Christianity, Hinduism, Buddhism and Judaism) [17]. Biofield Energy Treatment (The Trivedi Effect®) has been extensively studied with significant outcomes in many scientific fields such as agriculture [18-20], biotechnology [21-23], materials science [24-28], pharmaceutical sciences [29-31], medical science [32, 33], and microbiology [34-36]. Literature demonstrated that Biofield Energy Healing Treatment (The Trivedi Effect®) might be an alternative method for increasing or decreasing the natural isotopic abundance ratio of the substances [37, 38]. The stable isotope ratio analysis has the wide applications in several scientific fields for understanding the isotope effects resulting from the variation of the isotopic composition of the molecule [39, 40]. Conventional mass spectrometry (MS) techniques such as liquid chromatography - mass spectrometry (LC-MS), gas chromatography - mass spectrometry (GC-MS) are widely used for isotope ratio analysis with sufficient precision [41]. Hence, LC-MS and NMR (Nuclear Magnetic Resonance) were used in this study to characterize the structural properties of the Biofield Energy Treated and untreated magnesium gluconate qualitatively for the purpose of the pharmaceutical and nutraceutical industrial applications. Consequently, LC-MS based isotopic abundance ratio analysis of \( P_{M+1}/P_M \) (H/H or \(^{13}\)C/\(^{12}\)C or \(^{17}\)O/\(^{16}\)O or \(^{25}\)Mg/\(^{24}\)Mg) in both of the Biofield Energy Treated and untreated samples was targeted to evaluate the influence of Biofield Energy Healing Treatment on the isotopic abundance ratio in magnesium gluconate.
2. Materials and Methods

2.1. Chemicals and Reagents

Magnesium gluconate hydrate was procured from Tokyo Chemical Industry Co., Ltd. (TCI), Japan. All other chemicals used in the experiment were of analytical grade available in India.

2.2. Energy of Consciousness Treatment Strategies

Magnesium gluconate was one of the components of the new proprietary herbomineral formulation, which was developed by our research team and was used per se as the test compound for the current study. The test compound was divided into two parts. One part of the test compound did not receive any sort of treatment and defined as untreated or control magnesium gluconate sample. Consequently, another part of the test compound was treated with The Trivedi Effect® - Energy of Consciousness Healing Treatment remotely by eighteen renowned Biofield Energy Healers and defined as Biofield Energy Treated magnesium gluconate. Eleven of the Biofield Energy Healers were located in the U. S. A., four in Canada, one in Ireland, one in the United Kingdom, and one in Russia performed the Biofield Energy Treatment on the test compound that was located in the research laboratory of GVK Biosciences Pvt. Ltd., Hyderabad, India. The Biofield Energy Treatment was provided for 5 minutes through the Healer’s Unique Energy Transmission process remotely to the test compound, which was kept under laboratory conditions. None of the Biofield Energy Healers in this study visited the laboratory in person, nor had any contact with the compounds. Similarly, the control compound was subjected to a “sham” healer for 5 minutes, under the same laboratory conditions. The sham healer did not have any knowledge about the Biofield Energy Treatment. After that, the Biofield Energy Treated and untreated samples were kept in similar sealed conditions. The control and Biofield Energy Treated samples were analyzed by LC-MS and NMR spectroscopy.

2.3. Characterization

2.3.1. Liquid Chromatography-Mass Spectrometry (LC-MS) Analysis

Liquid chromatography was accomplished using The Waters® ACQUITY UPLC, Milford, MA, USA equipped with a binary pump (The Waters® BSM HPLC pump), autosampler, column heater and a photo-diode array (PDA) detector. The column used for the study was a reversed phase Acquity BEH shield RP C18 (150 X 3.0 mm, 2.5 µm). The column temperature was kept constant at 40°C. The mobile phase was 2mM ammonium acetate in water as mobile phase A and acetonitrile as mobile phase B. Chromatographic separation was achieved with the following gradient program: 0 minute - 5%B; 1 minute - 5%B; 15 minutes - 97%B; 20 minutes - 97%B; 21 minutes - 5%B; 25 minutes - 5%B. The flow rate was at a constant flow rate of 0.4 mL/minutes. The control and Biofield Energy Treated samples were dissolved in a mixture of water and methanol (60:40 v/v) to prepare a 1 mg/mL stock solution. An aliquot of 2 µL of the stock solution was used for analysis by LC-ESI-MS and the total run time was 25 minutes.

Mass spectrometric analysis was accompanied on a Triple Quad (Waters Quattro Premier XE, USA) mass spectrometer equipped with an electrospray ionization (ESI) source with the following parameters: electrospray capillary voltage 3.5 kV; source temperature 100°C; desolvation temperature 350°C; cone voltage 30 V; desolvation gas flow 1000 L/h and cone gas flow 60 L/h. Nitrogen was used in the electrospray ionization source. The multiplier voltage was set at 650 V. LC-MS was taken in positive and negative ionization mode and with the full scan (m/z 50-1400). The total ion chromatogram, peak area% and mass spectrum of the individual peak (appeared in LC) were recorded.

2.3.2. Isotopic Abundance Ratio Analysis

The isotopic abundance ratio of the control and Biofield Energy Treated magnesium gluconate was performed. The natural abundance of each isotope can be predicted from the comparison of the height of the isotope peak with respect to the base peak, i.e. relative abundance in the mass spectra [37, 38, 42, 43]. The natural isotopic abundance of the elements are obtained from several literatures [43-45] are presented in Table 1.

A: Element; n: no of H, C, O, Mg, etc.

The following method was used for calculating the isotopic abundance ratio:

P_M stands for the relative peak intensity of the parent molecular ion [M⁺] expressed in percentage. In other way, it indicates the probability to have A element (for e.g. ^12C, ^1H, ^16O, ^24Mg, etc.) contributions to the mass of the parent
molecular ion \([M^+]\).

\[ P_{M+1} \] represents the relative peak intensity of the isotopic molecular ion \([M+1]^+\) expressed in percentage

\[ = \frac{(\text{no. of } ^{13}\text{C} \times 1.1\%) + (\text{no. of } ^2\text{H} \times 0.015\%) + (\text{no. of } ^{17}\text{O} \times 0.04\%) + (\text{no. of } ^{25}\text{Mg} \times 12.66\%)}{\text{total number of atoms}} \]

\[ \text{i.e. the probability to have } A + 1 \text{ element (for e.g. } ^{13}\text{C}, ^2\text{H}, ^{25}\text{Mg}, \text{ etc.) contributions to the mass of the isotopic molecular ion } [(M+1)^+] \]

\[ P_{M+2} \] represents the relative peak intensity of the isotopic molecular ion \([M+2]^+\) expressed in percentage

\[ = \frac{(\text{no. of } ^{18}\text{O} \times 0.20\%) + (\text{no. of } ^{26}\text{Mg} \times 13.94\%)}{\text{total number of atoms}} \]

\[ \text{i.e. the probability to have } A + 2 \text{ elements (for e.g. } ^{18}\text{O}, ^{26}\text{Mg}, \text{ etc.) contributions to the mass of isotopic molecular ion } [(M+2)^+] \]

Isotopic abundance ratio (IAR) for \(A + 1\) elements = \(P_{M+1}/P_M\)

Similarly, isotopic abundance ratio of \(A + 2\) elements = \(P_{M+2}/P_M\)

Percentage (%) change in isotopic abundance ratio = \[
\frac{[(\text{IAR}_{\text{Treated}} - \text{IAR}_{\text{Control}})/\text{IAR}_{\text{Control}}] \times 100}{\text{(1)}}
\]

Where, \(\text{IAR}_{\text{Treated}}\) is isotopic abundance ratio in the treated magnesium gluconate sample and \(\text{IAR}_{\text{Control}}\) is isotopic abundance ratio in the control magnesium gluconate sample.

2.3.3. Nuclear Magnetic Resonance (NMR) Analysis

\(^1\text{H} \text{NMR spectra were recorded in a 400 MHZ VARIAN FT-NMR spectrometer at room temperature. Data refer to solutions in } \text{D}_2\text{O with the residual solvent protons as internal references. } ^1\text{H NMR multiplicities were designated as singlet (s), doublet (d), triplet (t), multiplet (m), and broad (br). } ^{13}\text{C} \text{NMR spectra were measured at 100 MHz on a VARIAN FT-NMR spectrometer at room temperature. Chemical shifts (} \delta \text{) were in parts per million (ppm) relative to the solvent’s residual proton chemical shift (} \text{D}_2\text{O, } \delta = 4.65 \text{ ppm) and solvent’s residual carbon chemical shift (} \text{D}_2\text{O, } \delta = 0 \text{ ppm)[46].}}\]

3. Results and Discussion

3.1. Liquid Chromatography-Mass Spectrometry (LC-MS) Analysis

The total ion chromatograms (TIC) of the control and Biofield Energy Treated magnesium gluconate are shown in Figure 1. The TIC of the control magnesium gluconate showed two peaks at retention time \(R_t\) of 1.81 and 2.06 minutes with the peak area% of 61.22% and 38.78%, respectively in the chromatogram. Similarly, the chromatogram of the Biofield Energy Treated magnesium gluconate exhibited two peaks at \(R_t\) of 1.79 and 2.04 min with the peak area% of 61.77% and 38.23%, respectively.

The results indicated that Biofield Energy did not show any impact in the alteration of the polarity/affinity of the Biofield Energy Treated magnesium gluconate compared with the control sample.

The ESI-MS spectra of both the control and Biofield Energy Treated samples are presented in Figure 2 and 3. The ESI-MS (+ve ion mode) spectra of both the control and Biofield Energy Treated magnesium gluconate at \(R_t\) of 2.1 minutes (Figure 2) indicated the presence of the mass for protonated magnesium gluconate ion at \(m/z\) 415 \([M + H]^+\) (calculated for \(C_{12}H_{23}MgO_{14}^+\), 415). Adducts formation, either with solvents (i.e. methanol), alkali or metal ions or other contaminating components are frequently observed in the ESI analysis [47, 48].

![Figure 1. Total ion chromatograms (TIC) of the control and Biofield Energy Treated magnesium gluconate using The Waters® ACQUITY UPLC.](image-url)
The pseudo molecular ion magnesium gluconate at m/z 447 displayed 100% relative intensity in the control sample, while the fragment ion peak at m/z 100 exhibited the 100% relative peak intensity in the Biofield Energy Treated sample. The notable fragment ion peaks in the lower region of the molecular ion at m/z 415 were observed in the ESI-MS spectrum of the control sample at m/z 380, 279, 272, 255, 206, 190, 161, 153, 147, 135, 121, and 105, due to the successive removal of water and alkyl groups from \([M + H]^+\) and consequently, the internal molecular rearrangement, corresponded to the following proposed molecular formula \(C_{12}H_{20}MgO_{12}^+, \ C_{13}H_{21}MgO_{11}^+, \ C_{12}H_{22}MgO_{10}^+, \ C_{12}H_{23}MgO_{9}^+, \ C_{12}H_{24}MgO_{8}^+, \ C_{12}H_{25}MgO_{7}^+, \ C_{12}H_{26}MgO_{6}^+, \ C_{12}H_{27}MgO_{5}^+, \ C_{12}H_{28}MgO_{4}^+, \ C_{12}H_{29}MgO_{3}^+, \ C_{12}H_{30}MgO_{2}^+, \ C_{12}H_{31}MgO^+, \ C_{12}H_{32}MgO^{-}, \ C_{12}H_{33}MgO^{2-}, \ C_{12}H_{34}MgO^{3-}\) respectively as shown in Figure 4. The peak at m/z 431, which was due to the magnesium gluconate adduct with the ammonium ion was only found in the control sample. This ammonium adduct formation might be due to the usage of ammonium acetate with water as mobile phase [47, 48]. The other major ions in the higher m/z region of the control ESI-MS spectrum (Figure 2) were found at m/z 613, 643 and 665. These mass indicated for the mass of the magnesium gluconate chelate with one gluconate ion through coordinate covalent bond \((C_{18}H_{33}MgO_{21}, 609)\) as shown in Figure 4. But it existed in three different pseudo-molecular ions. First pseudo-molecular ion was at m/z 613 (calcd for \(C_{18}H_{33}MgO_{21}^{4+}\), 613). The second pseudo-molecular ion was due to the adduct formation with methanol at m/z 643 (calcd for \(C_{19}H_{33}MgO_{23}^{4+}\), 643). The last pseudo-molecular ion was at m/z 665 (calcd for \(C_{20}H_{33}MgO_{25}^{4+}\), 665) due to the adduct formation of \(C_{18}H_{33}MgO_{21}^{4+}\) with one Mg^{2+} atom as well as with methanol. Consequently, the characteristic fragment ion peaks in the ESI-MS spectrum of Biofield Energy Treated sample were observed at m/z 387, 357, 284, 272, 219, 197, 179, 147, 133, 115, and 100, which corresponded to the following proposed molecular formula \(C_{12}H_{20}MgO_{12}^{4+}, \ C_{11}H_{22}MgO_{11}^{4+}, \ C_{10}H_{24}MgO_{10}^{4+}, \ C_{9}H_{26}MgO_{9}^{4+}, \ C_{8}H_{28}MgO_{8}^{4+}, \ C_{7}H_{30}MgO_{7}^{4+}, \ C_{6}H_{32}MgO_{6}^{4+}, \ C_{5}H_{34}MgO_{5}^{4+}, \ C_{4}H_{36}MgO_{4}^{4+}, \ C_{3}H_{38}MgO_{3}^{4+}, \ C_{2}H_{40}MgO_{2}^{4+}, \ C_{1}H_{42}MgO\) respectively (Figure 4). The prominent ions observed in the higher m/z region of the Biofield Energy Treated ESI-MS spectrum (Figure 2) were at m/z 611 and 643 corresponding to the molecular formula \(C_{18}H_{33}MgO_{21}^{4+}\) and \(C_{19}H_{33}MgO_{23}^{4+}\) that was due to the magnesium gluconate chelate with one gluconate ion.
After Treatment with the Energy of Consciousness Using LC-MS and NMR Spectroscopy

Figure 4. Proposed fragmentation pathway of magnesium gluconate.

Similarly, the ESI-MS (-ve ion mode) spectra of magnesium gluconate of both the control and Biofield Energy Treated samples found at R_t of 1.8 minutes revealed the presence of gluconate ion at m/z 195 [M - H]^- (calculated for C_{6}H_{11}O_{7}) 195 with 100% base peak intensity. A dimeric form of the gluconate ion was found at m/z 391 [2M - H]^- (calculated for C_{12}H_{23}O_{14}, 391) both in the control and Biofield Energy Treated samples. Overall, from the above data, it can be concluded that the fragmentation pattern of the Biofield Energy Treated magnesium gluconate was significantly altered compared with the control sample. From the analysis, the pseudo molecular ion formation found less in case of the Biofield Energy Treated sample compared with the control sample in solution.

3.2. Isotopic Abundance Ratio Analysis

The molecular formula of magnesium gluconate is C_{12}H_{22}MgO_{14}. The LC-MS spectra of both the control and Biofield Energy Treated samples indicated the presence of the mass for protonated molecular ion at m/z 415 (C_{12}H_{22}MgO_{14}^+) showing 53.31% (control) and 48.73% (Biofield Energy Treated) relative intensity. The relative abundances of an isotopic peak are the contributions of several different isotopes and its composition to the same peak [43]. The theoretical calculation of P_{M+1} for the protonated magnesium gluconate was presented as below:

\[
P(^{13}\text{C}) = [(12 \times 1.1\%) \times 53.31\% \text{ (the actual size of the M^+ peak)}] / 100\% = 7.04\%
\]
\[
P(^{2}\text{H}) = [(23 \times 0.015\%) \times 53.31\%] / 100\% = 0.18\%
\]
\[
P(^{17}\text{O}) = [(14 \times 0.04\%) \times 53.31\%] / 100\% = 0.30\%
\]
\[
P(^{25}\text{Mg}) = [(1 \times 12.66\%) \times 53.31\%] / 100\% = 6.75\%
\]

Thus, the probability to A + 1 elements having an isotope that has one mass unit heavier than the most abundant isotope (i.e. ^{13}\text{C}, ^{2}\text{H}, ^{17}\text{O}, and ^{25}\text{Mg}) contributions to the mass of the isotopic molecular ion [(M+1)^+]. In general, the deuterium did not contribute much to any isotopic mass, because the natural abundance of deuterium is too small relative to the natural abundances of carbon, oxygen and magnesium isotopes [43-45]. Hence, ^{13}\text{C} and ^{25}\text{Mg} have the major contributions from magnesium gluconate and magnesium gluconate to the isotopic peaks. The percentage change in isotopic abundance ratio of P_{M+1}/P_{M} for magnesium gluconate in the Biofield Energy Treated and control samples are presented in Table 2. The isotopic abundance ratio of P_{M+1}/P_{M} in the Biofield Energy Treated magnesium gluconate was decreased by 79.24% compared with the control sample (Table 2). ^{13}\text{C} and ^{25}\text{Mg} contributions from C_{12}H_{22}MgO_{14}^+ to m/z 416 = 14.27%
The gluonic acid ion (C₆H₁₇O₇⁻), in the control and Biofield Energy Treated sample showed 100% relative peak intensity. The abundance of parent molecular ion (Pₐ) was at m/z 196, and its size was determined solely by the most abundant element composition. Pₐ can be calculated theoretically and described below:

\[ P( ^{13}C) = \frac{[(6 \times 1.1\%) \times 100\%]}{100\%} = 6.60\% \]

\[ P( ^{15}N) = \frac{[(11 \times 0.015\%) \times 100\%]}{100\%} = 0.17\% \]

\[ P( ^{17}O) = \frac{[(7 \times 0.04\%) \times 100\%]}{100\%} = 0.28\% \]

\[ P_{M+1} = \text{isotopic abundance ratio of P}_{M+1}/P_M \text{ with respect to the control sample} \]

\[ \% \text{ Change of isotopic abundance ratio} = \frac{P_{M+1}/P_M - P_{M+1}/P_M^{control}}{P_{M+1}/P_M^{control}} \times 100\% \]

The calculated abundance of Pₐ (7.05%) in magnesium gluconate closely matched to the experimental value obtained in the control sample (Table 3). The isotopic abundance ratio of Pₐ in the gluconate ion was significantly decreased by 6.62% in the Biofield Energy Treated sample compared with the control sample. Hence, ^13C, ^2H, and ^17O contributions from (C₆H₁₇O₇O)^⁺ to m/z 196 was decreased in the Biofield Energy Treated sample compared with the control sample.

Pₐ : the relative peak intensity of the parent molecular ion [M⁺]; Pₐ+1 : the relative peak intensity of the isotopic molecular ion [(M⁺+1)⁺].

Briefly, ^13C, ^2H, ^17O, and ^25Mg contributions from (C₆H₁₂MgO₆)^⁺ to m/z 416 in the Biofield Energy Treated sample was significantly decreased with respect to the control sample. ^13C, ^2H, and ^17O contributions from (C₆H₁₇O₇O)^⁺ to m/z 196 was also decreased in the Biofield Energy Treated sample comparison with the control sample. Overall, the isotopic abundance ratio of Pₐ/Pₐ in (H/He or ^13C/¹²C or ^17O/¹⁶O or ^25Mg/²⁴Mg) in the Biofield Energy Treated magnesium gluconate was significantly decreased compared with the control sample. The alteration in the isotopic abundance ratio could be due to the Biofield Energy Healing Treatment.

Scientific literature reported that the vibrational energy is closely related with the reduced mass (μ) of the compound and the alteration of the vibrational energy can affect the several characteristics like physicochemical, thermal properties of the molecule [37, 38, 52, 53]. Replacement of the isotopic composition of the magnesium gluconate significantly alters the vibrational energy [41, 52, 53]. The vibrational energy depends on the reduced mass (μ) for a diatomic molecule as shown below (equation 2):

\[ E_v = \frac{\hbar^2}{8 \mu} \sqrt{f} \]

Where, \( E_v \) = the vibrational energy of a harmonic oscillator at absolute zero or zero point energy; \( f \) = force constant

\[ \mu = \text{reduced mass} = \frac{m_a m_b}{m_a + m_b} \]

Where \( m_a \) and \( m_b \) are the masses of the constituent atoms.

The reduced mass (μ) of some of the probable isotopic bonds were calculated for magnesium gluconate and its possible fragmentations, and the results showed that μ of heavier isotopes \( (i.e. ^{13}C, ^{2}H, ^{17}O) \) for C-O, C-H, and O-H bonds were calculated for magnesium gluconate and its possible fragmentations, and the results showed that μ of heavier isotopes [i.e. ^13C, ^2H, ^17O] (μ=1.71), ^19O, ^17H (μ=7.17), ^18O-^12H (μ=1.78), ^25Mg-^16O (μ=9.76), and ^24Mg-^17O (μ=9.95), etc.] were increased than the normal bond [i.e. ^12C-^16O (μ=6.24), ^11H-^14O (μ=0.92), ^10O-^12C (μ=6.86), ^10O-H (μ=0.94) and ^24Mg-^17O (μ=9.60)] (Table 4).

Table 4. Possible isotopic bonds, reduced mass and their effect on the vibrational energy in magnesium gluconate.

\( m_A \): mass of atom A; \( m_B \): mass of atom B, here A and B may be C or H or O or Mg.

The alteration in the isotopic abundance ratio of ^13C-^12C for C-O; ^2H/^1H for C-H and O-H bonds; ^17O/¹⁶O for C-O bond; ^25Mg/²⁴Mg and ^17O/¹⁶O for Mg-O bond has the significant impact on the ground state vibrational energy of the molecule due to the higher reduced mass (μ) as shown in the Table 4 that leads to the isotope effects of the molecule.

Mass spectroscopic analysis of the several organic compounds revealed that the isotope abundance of [M+1]⁺ ions were decreased, thereby suggesting the change in number of neutrons in the molecule. It was then postulated to the alterations in atomic mass and atomic charge through the possible mediation of neutrino oscillation [52-54]. Thus, it is assumed that The Trivedi Effect® - Biofield Energy Healing might provide the required energy for the neutrino
oscillations. The changes of neutrinos inside the molecule in turn modified the particle size, chemical reactivity, density, thermal behavior, selectivity, binding energy, etc. [44, 54].

Kinetic isotope effect that is resultant from the variation in the isotopic abundance ratio of one of the atoms in the reactants in a chemical reaction is very useful to study the reaction mechanism as well as for understanding the enzymatic transition state and all aspects of enzyme mechanisms that is supportive for designing enormously effective and specific inhibitors [41, 49, 51]. As magnesium is an essential cofactor for various enzymatic reactions, the Biofield Energy Treated magnesium gluconate that had altered isotopic abundance ratio might be useful for the study of enzyme mechanism as well as assist in the designing of novel potent enzyme inhibitors.

3.3. Nuclear Magnetic Resonance Spectroscopy ($^1$H and $^{13}$C NMR) Analysis

The $^1$H and $^{13}$C NMR spectra of the control and Biofield Energy Treated magnesium gluconate are shown in Figures 5a-d. NMR assignments of the control and Biofield Energy Treated magnesium gluconate are presented in the Table 5. The structure of magnesium gluconate contain a large number of OH groups and the hydroxyl protons have no signal in the $^1$H NMR spectra because these protons are replaced by deuterium when deuterated water ($D_2O$) was used as solvent for spectra recording. The signals for the protons and carbon signals for CH, CH$_2$, and CO groups in the proton and carbon NMR spectra of the control and the Biofield Energy Treated samples were found almost similar. It was then concluded that the structure of the magnesium gluconate was remained unaltered due to the Biofield Energy Healing Treatment.

s: singlet; br: broad; m: multiplet; * these assignments can be switched.

The signals for the carbon signals for CO, CH$_2$, and CH groups in the $^{13}$C NMR spectra of the control and Biofield Energy Treated magnesium gluconate were in the range of $\delta$ 62.60-178.44 ppm and $\delta$ 62.43-178.44 ppm, respectively. Thus, the proton and carbon signals for CH, CH$_2$ and CO groups in the proton and carbon NMR spectra of the control and the Biofield Energy Treated samples were found almost similar. It was then concluded that the structure of the magnesium gluconate was remained unaltered due to the Biofield Energy Healing Treatment.

4. Conclusions

LC-ESI-MS analysis indicated that magnesium gluconate in the solution might be existed in situ of three forms, magnesium gluconate, gluconic acid and a chelate form of magnesium gluconate with the gluconic acid by the coordinate covalent bond. The total ion chromatogram (TIC) of the control sample showed two peaks at R\textsubscript{t} of 1.81 and 2.06 minutes, whereas The Trivedi Effect\textsuperscript{\textregistered} treated sample displayed these peaks at R\textsubscript{t} of 1.79 and 2.04 minutes. The ESI-MS spectra of the control and the treated samples revealed the presence of the mass for magnesium gluconate ion in two forms at m/z 447 (adduct form with methanol) and 415 (protonated ion) in positive ionization mode. But, it showed the mass for the gluconate ion at m/z 195 in the negative ionization mode. The fragmentation pattern of magnesium gluconate in the treated sample was significantly altered as compared to the control sample. Consequently, the LC-ESI-MS based isotopic abundance ratio analysis indicated that the P\textsubscript{M+1}/P\textsubscript{M} ([H/H] or [13C/12C] or [17O/16O] or [25Mg/24Mg]) in the Biofield Energy Treated magnesium gluconate ion at m/z 415 was significantly decreased by 79.24\% compared with the control sample. Similarly, the isotopic abundance ratio of P\textsubscript{M+1}/P\textsubscript{M} ([H/H] or [13C/12C] or [17O/16O]) in gluconate was decreased by 6.62\% in the treated sample compared with the control sample. Briefly, [13C, 17O, and 25Mg contributions from (C\textsubscript{6}H\textsubscript{12}MgO\textsubscript{14})\textsuperscript{+}] to m/z 416 in the Biofield Energy Treated sample was significantly decreased with respect to the control sample. [13C, 17O, and 17O contributions from (C\textsubscript{6}H\textsubscript{12}O\textsubscript{14})\textsuperscript{+}] to m/z 196 was also decreased in the treated sample in comparison with the control sample. The treated sample might exhibit isotopic effects such as altered physicochemical and thermal properties, rate of the reaction, selectivity and binding energy due to its changed isotopic abundance ratio of P\textsubscript{M+1}/P\textsubscript{M} compared with the control sample. The treated magnesium gluconate might be helpful to understand the enzymatic reactions as well as design the novel potent enzyme inhibitors by using its kinetic isotope effects. Besides, The Trivedi Effect\textsuperscript{\textregistered} - Energy of Consciousness Healing Treatment, could be a useful approach in the design of better nutraceutical and/or pharmaceutical formulations that can offer significant therapeutic responses against various diseases such as diabetes mellitus, allergies and septic shock, stress-related disorders like sleep disorder, insomnia, anxiety, depression, Attention Deficit Disorder (ADD), Attention Deficit Hyperactive Disorder (ADHD), mental restlessness (mind chattering), brain fog, low libido, impotency, lack of motivation, mood swings, fear of the future, confusion, migraines, headaches, forgetfulness, overwhelming, loneliness, worthlessness, indecisiveness, frustration, irritability, chronic fatigue, obsessive/compulsive behavior and panic attacks, inflammatory diseases and immunological disorders like Lupus, Systemic Lupus Erythematosus, Hashimoto Thyroiditis, Type 1 Diabetes, Asthma, Chronic peptic ulcers, Tuberculosis, Hepatitis, Chronic active hepatitis, Celiac Disease (gluten-sensitive enteropathy), Addison Disease, Crohn's disease, Graves' Disease, Pernicious and Aplastic Anemia, Sjogren Syndrome, Irritable Bowel Syndrome (IBS), Multiple Sclerosis, Rheumatoid arthritis, Chronic periodontitis, Ulcerative colitis, Chronic sinusitis, Myasthenia Gravis, Atherosclerosis, Vasculitis, Dermatitis, Diverticulitis, Rheumatoid Arthritis, Reactive Arthritis, Alopecia Areata, Psoriasis, Scleroderma, Fibromyalgia, Chronic Fatigue Syndrome and Vitiligo, aging-related diseases like cardiovascular disease, arthritis, cancer, Alzheimer’s disease, dementia, cataracts, osteoporosis, diabetes, hypertension, glaucoma, hearing loss, Parkinson’s Disease, Huntington’s Disease, Prion Disease, Motor Neurone Disease, Spinocerebellar Ataxia, Spinal muscular atrophy, Amyotrophic lateral sclerosis, Friedreich’s Ataxia and Lewy Body Disease; chronic infections and much more.
